Introduction to Botany

Alexey Shipunov

Minot State University

Lecture 8

Outline

1. Photosynthesis
   - Light stage: electron transport, synthesis of ATP and NADPH

Photosynthesis

Light stage: electron transport, synthesis of ATP and NADPH

Participants of light stage

A. Chlorophyll (photosystems II and I)
B. Light
C. Water
D. ATP synthase (ATPase)
E. Protons (H^+)
F. Hydrogen carrier ($NADP^+$)

Main events of light stage

A. Chlorophyll + Light $\longrightarrow$ Electron (e^-) + Chlorophyll$^+$

B. e^- + H^+ (from water) + Hydrogen carrier ($NADP^+$) $\longrightarrow$ NADPH (moves away)

C. $H_2O \longrightarrow H^+$ (accumulates inside) + e^- + O_2

D. H^+ (inside) + OH^- (from water, located outside) $\Longrightarrow$ gradient $\Longrightarrow$ proton pump $\Longrightarrow$ H_2O
TOGETHER WITH
ADP + P_i (inorganic phosphate) $\longrightarrow$ **ATP**

Photosystems

- Photosystem II (P_{680}, contains chlorophylls and carotene):
  A. decomposes water;
  B. forwards electron to Photosystem I;
  C. makes proton gradient
- Photosystem I (P_{700}, contains only chlorophylls) makes NADPH

Photosystems movie

Results of the light stage

At the start	At the end
H_2O	H_2O (result of pump) and $\mathbf{O_2}$
Chlorophylls	Chlorophylls
ADP and P_i (inorganic phosphate)	ATP
$NADP^+$	NADPH

Quiz question (2 points)

Quiz question (2 points)

Explain the role of $NADP^+$

Summary

- **Photosynthesis** is a sum of light-dependent and light-independent reactions
- **Light stage** of photosynthesis results in accumulation of energy and hydrogen, and release of oxygen
