Model organisms
Previous final question: the answer

What is that?
Previous final question: the answer

What is that?

- Synapse—the contact between two neural cells (neurons)
Introduction to cells

Microscopy
Microscopes

Light microscopy based on visible light rays and glass optics, most common are “transparency” microscopes where light goes through object (stained with specific dyes or not stained); there are also “reflection” (dissectiscopes) and fluorescent microscopes.

Transmission electron microscopy (TEM) based on the flow of electrons through specially prepared (usually stained with osmium, Os), extremely thin object; allows to see the internal organization of cells and organelles.

Scanning electron microscopy (SEM) based on the electronic reflection from the surface covered with metals (typically, gold, Au) and provides an image of the surface of cells and organisms.

the light path in a light microscope
Electron microscopy

TRANSMISSION ELECTRON MICROSCOPY
- electron gun
- condenser lens
- specimen
- objective lens
- projector lens
- viewing screen or photographic film

SCANNING ELECTRON MICROSCOPY
- electron gun
- condenser lens
- beam deflector
- objective lens
- scan generator
- video screen
- detector
- electrons from specimen
- specimen
Introduction to cells
Prokaryotic and eukaryotic cells
Organelles in prokaryotic and eukaryotic cells

- **Prokaryotic:** [cell wall], plasma membrane, cytosol, [vacuoles], [prokaryotic flagella], nucleoid, [tlyacoids]

- **Eukaryotic:** [cell wall], plasma membrane, cytosol, nucleus, mitochondria, [chloroplasts], endoplasmatic reticulum, [Goldgi apparatus], vesicles (vacuoles, lysosomes etc.), cytoskeleton, [eukaryotic flagella]
Comparison of prokaryotic and eukaryotic cells

Please copy drawings from a board
Comparative biology of prokaryotic and eukaryotic cells

- Eukaryotic cells are 10–100 times bigger than prokaryotic
- Eukaryotes have cell motility and capable to endo- and exocytosis
- Prokaryotes have combined RNA and protein synthesis
- Prokaryotes are more diverse chemically, whereas eukaryotes are more diverse morphologically
PVC bacteria have nucleus-like structures

[From Lee et al., 2010]
Symbiotic origin of eukaryotic cell

- Double membrane and own DNA are unique features of mitochondria and chloroplasts
- Originally, endosymbiosis was an idea of Russian scientists (Konstantin Merezhkovsky and Boris Kozo-Poljansky), it was revived in 60s by Lynn Margulis (UMass Amherst).
- The host cell was probably predatory archaeon (belongs to Archaea domain) or PVC bacteria (hypothesis of Forterre, 2010)
- Mitochondria were first symbionts, probably proteobacteria
- Chloroplasts appeared later, from cyanobacteria
Diversity of life and model organisms

- *Escherichia coli*, or *E. coli*: proteobacteria
- *Saccharomyces cerevisae*: fungal protist
- *Arabidopsis thaliana*: flowering plant from cabbage family
- *Drosophila melanogaster*: fly (Diptera) insect
- *Caenorhabditis elegans*: round worm (Nematoda)
- *Mus musculus*: common mouse (rodent mammal)
Less common model organisms

- *Gallus gallus*: chicken (Aves, birds)
- *Danio rerio*: zebrafish (Pisces)
- *Strongylocentrotus purpuratus*: purple sea urchin (Echinodermata)
- *Hydra vulgaris*: freshwater hydra (Cnidaria)
- *Trichoplax adhaerens*: basal animal (Placozoa)
- *Neurospora crassa*: orange bread mold (fungal protist)
- and many others
Zebrafish, *Danio rerio*
Sea urchin, *Strongylocentrotus purpuratus*
Hydra, *Hydra vulgaris*
Trichoplax adhaerens
Orange bread mold, *Neurospora crassa* under fluorescent microscope
Final question (2 points)
Final question (2 points)

Which organelle is present in most prokaryotic cells and absent in all eukaryotic?
Summary

- Electron microscope can only work with dead cells
- Eukaryotic cells are “cells of second level” where part of organelles (mitochondria, chloroplasts) originated from different prokaryotic cells.
